Overview Solutions

Two Sum

Easy Array

Given a list of integers and a target value, find two numbers in the list whose sum equals thhhhtwo numbers.

Example 1:

Input: nums = [4, 1, 6, 3], target = 7
Output: [0, 3]

Explanation: nums[0] + nums[3] = 4 + 3 = 7

Example 2:

Input: nums = [10, -2, 8, 5], target = 6
Output: [1, 2]

Code

```
class Solution {
public:
    vector<int> twoSum(vector<int> &nums, int target) {
        unordered_map<int, int> hash;
        for (int i = 0; i < nums.size(); i++) {
            hash[nums[i]] = i;
        }
        for (int i = 0; i < nums.size(); i++) {
            int complement = target - nums[i];
            if (hash.find(complement) != hash.end() && hash[complement] != i) {
                return {i, hash[complement]};
            }
        }
        // If no valid pair is found, return an empty vector
        return {};
    }
};
```

Test Input

Case 1 Case 2

nums =
[4, 1, 6, 3]

target =
7

It works because the negative number just cancels part of the sum.
